

Spearman rank correlations between input parameters and BRR (DALY)

Top 12 parameters by |ρ| per scenario (low → moderate → high transmission). Positive ρ → BRR increases (vaccination more favourable). Negative ρ → BRR decreases (vaccination less favourable).

Transmission categories: low AR <5%, moderate 5–10%, high ≥10%. BRR (DALY) = DALY averted / DALY from vaccine-associated SAE per 10,000. BRR >1 = net benefit.
