

Spearman rank correlations between input parameters and the benefit-risk ratio (DALY) of traveller vaccination

Top 12 parameters by |p| per scenario (low → moderate → high transmission). Positive p → BRR increases (vaccination more favourable). Negative p → BRR decreases (vaccination less favourable).

Transmission categories: low AR <1%, moderate 1–10%, high ≥10%. BRR (DALY) = DALY averted / DALY from vaccine-associated SAE per 10,000. BRR >1 = net benefit.
