

Spearman rank correlations between input parameters and the benefit-risk ratio (DALY) of outbreak response immunisation

Top 12 parameters by | ρ | per scenario (low → moderate → high transmission). VE layer: Disease and infection blocking; BRR type: base (no serostatus adjustment).
Positive ρ → BRR increases (vaccination more favourable). Negative ρ → BRR decreases (vaccination less favourable).

Transmission categories are defined by state-level setting assignment (Low / Moderate / High).
BRR (DALY) = DALY averted / DALY from vaccine-associated SAE per 10,000. BRR >1 = net benefit.
